

# Model evaluation report

Module 6 - Lesson 1

## Overview

An evaluation report is the deliverable that makes a model trustworthy. It states the metric, methodology, results, limitations, and a recommendation in one document.

## Key Concepts

- Report the exact metric and how the train/validation/test split was made.
- Show results on the held-out test set, never on training data.
- Include baselines (random, majority, simple heuristic) for context.
- Document limitations: data coverage, failure modes, and edge cases.
- Recommend a decision: ship, iterate, or stop - with reasons.
- Keep the report reproducible so results can be regenerated.

## Example

```
Evaluation report outline:  
1. Problem and success metric  
2. Data summary and split  
3. Baseline results  
4. Model results (test set)  
5. Error analysis and confusion matrix  
6. Limitations and risks  
7. Recommendation
```

## Summary

An evaluation report converts model results into a decision. State metrics and method, compare to baselines, document limits, and make a clear, honest recommendation.

## Practice Checklist

- Produce a one-page evaluation report for a model you trained.
- Add a baseline comparison to your results.
- List two limitations and how you would address them.
